

**Tomo-e Gozen 突発天体サーベイと連携した  
Rapid Transient の観測**

**田中 雅臣 (東北大学)**

**on behalf of Tomo-e Gozen Transient Survey Team**

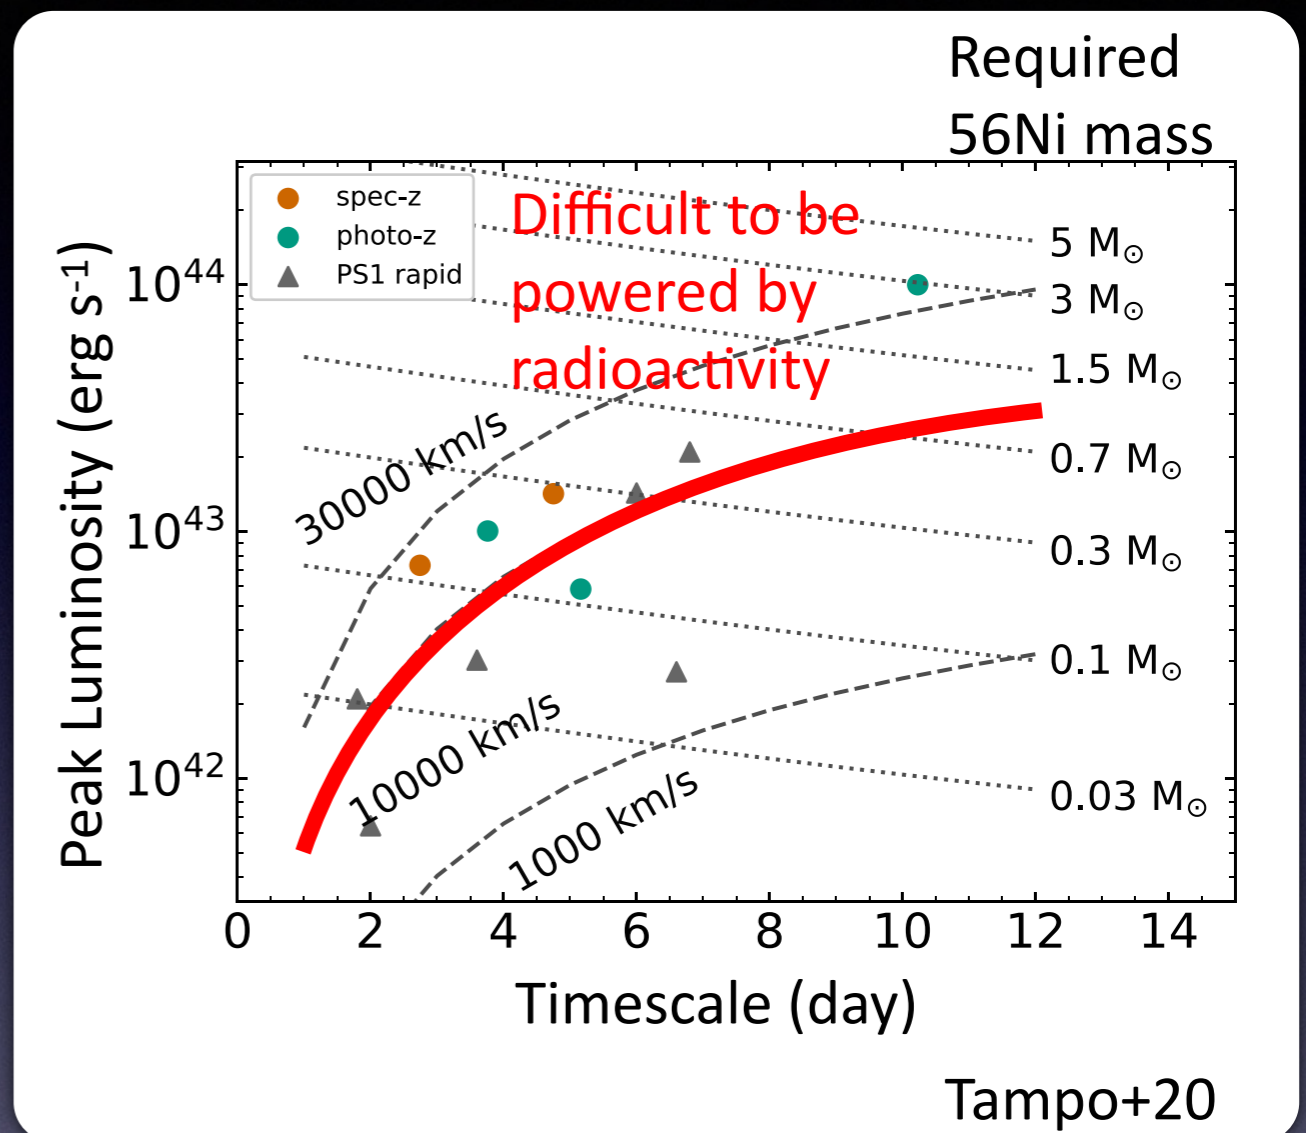

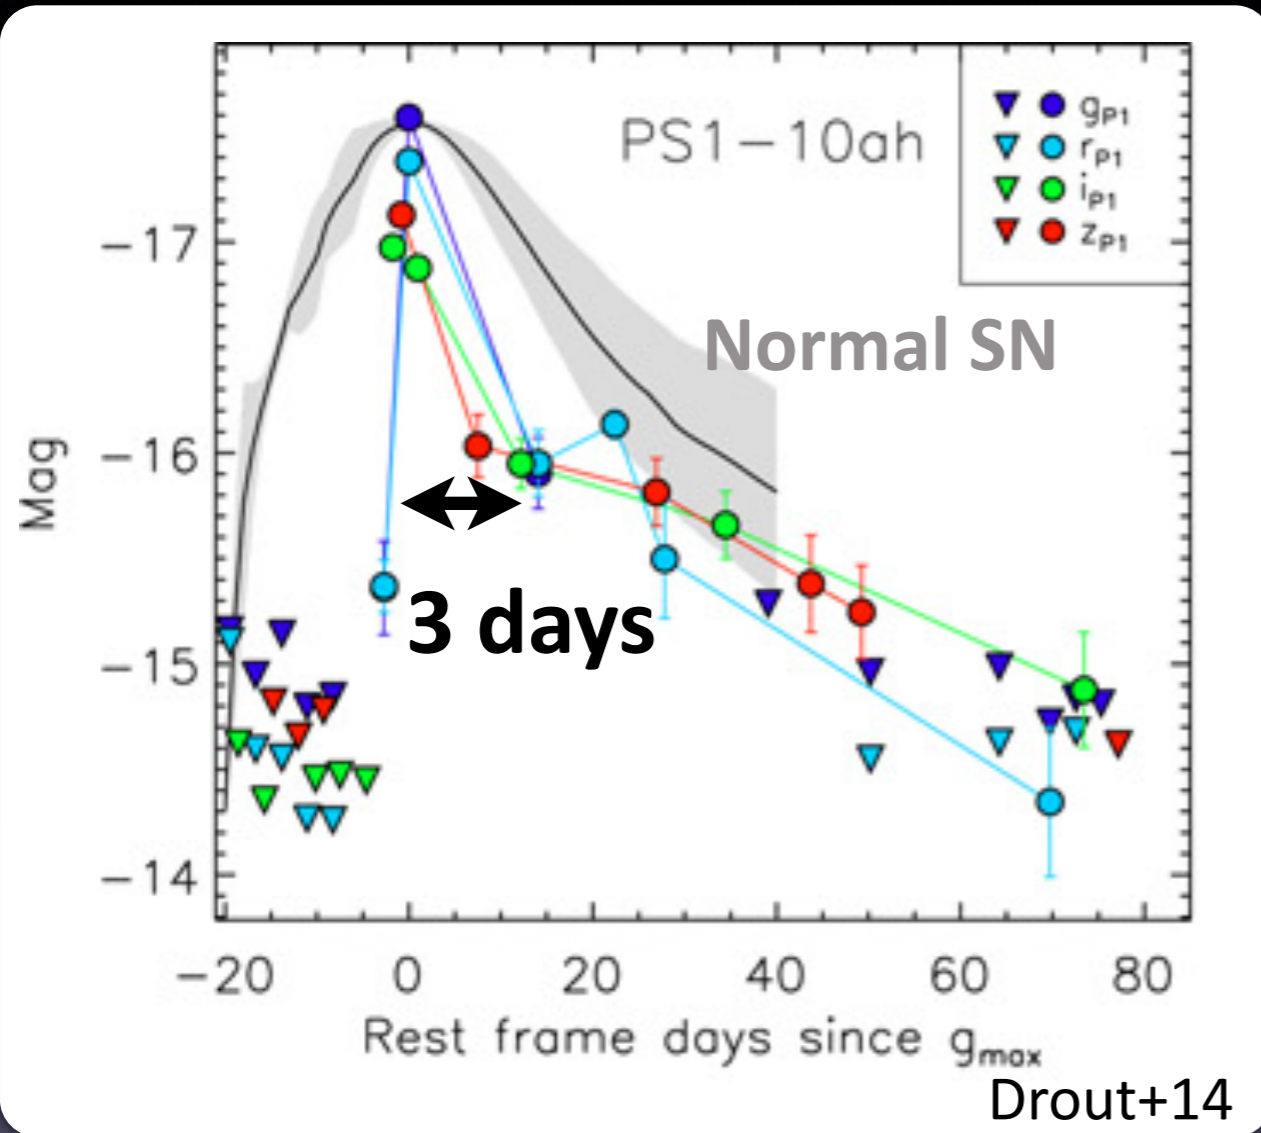

# Frontier of transient sky

# Transient survey

# Discovery of rapid transients

Compared with supernovae:

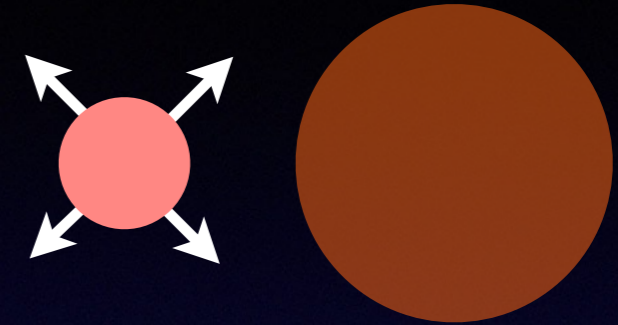

- Similar luminosity (w/ large diversity)
- Shorter time scale (= small mass involved)
- ~5 % event rate

# Origin of rapid transients?

## ● Ultra-stripped envelope SN?

- $M_{ej} \sim 0.1 M_{\text{sun}}$  by binary interaction (e.g., Tauris+13, Moriya+17)  
a route to neutron star merger?

$M_{ej} \sim 0.1 M_{\text{sun}}$

## ● BH-forming supernovae?

- Disk outflow (e.g., Kashiyama+15)  
or Accretion-powered transients? (e.g., Dexter & Kasen 13)

$M_{ej} \sim 0.01 M_{\text{sun}}$

## ● ...?

**Moderate samples so far**

Drout+14 (PS1, 2m), Pursiainen+18 (DES, 4m), Tambo+20 (Subaru, 8m)

=> **Difficult to perform spectroscopy**

**Need nearby, bright objects for spectroscopy**

# Tomo-e Gozen Transient Survey (2019/4-)

## ● Tomo-e Gozen @ Kiso Schmidt

- 84 CMOS sensors, no filter
- 20 deg<sup>2</sup> FOV  
=> Multi-messenger follow-up  
(Gravitational wave, IceCube neutrino)

## ● Survey strategy

- 7000 deg<sup>2</sup>
- 2 hour cadence
- 0.5 sec x 12 = 6 sec exposure  
=> 18 mag (5 sigma)
- ~ a few rapid transients / 0.5 yr (< 200 Mpc)

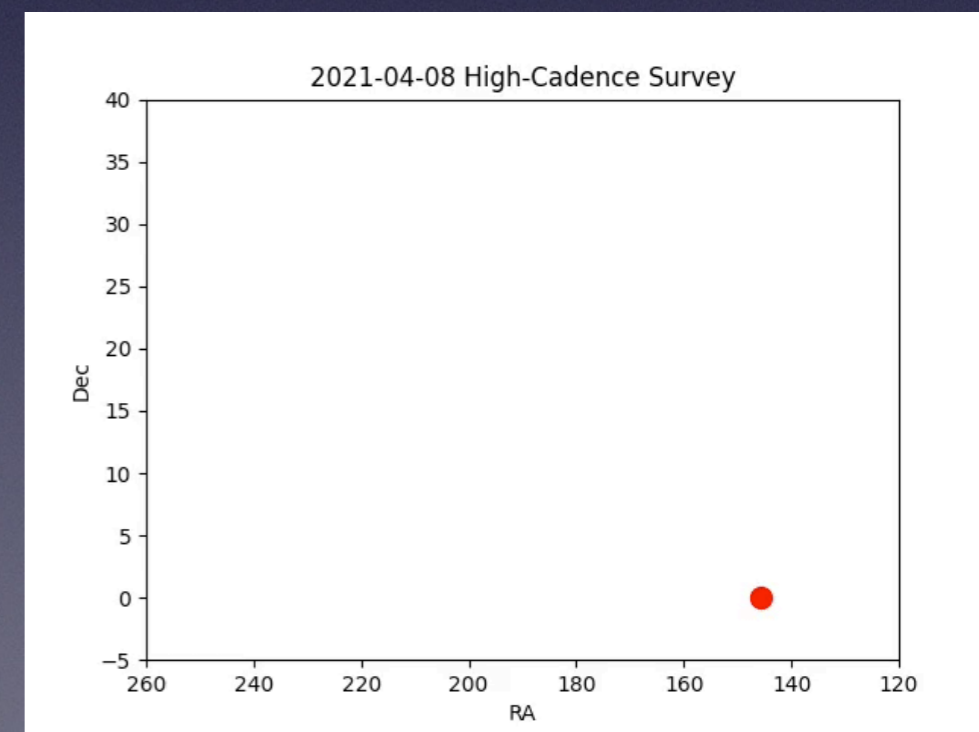

## ● Follow-up with Seimei

- 19A-21A (PI: Morokuma) KOOLS-IFU
- 21B (PI: Tanaka) KOOLS-IFU + TriCCS

High-sensitivity CMOS video sensors

## Pointing pattern

Pedroso, Ikeda, et al. in prep.

# Data flow

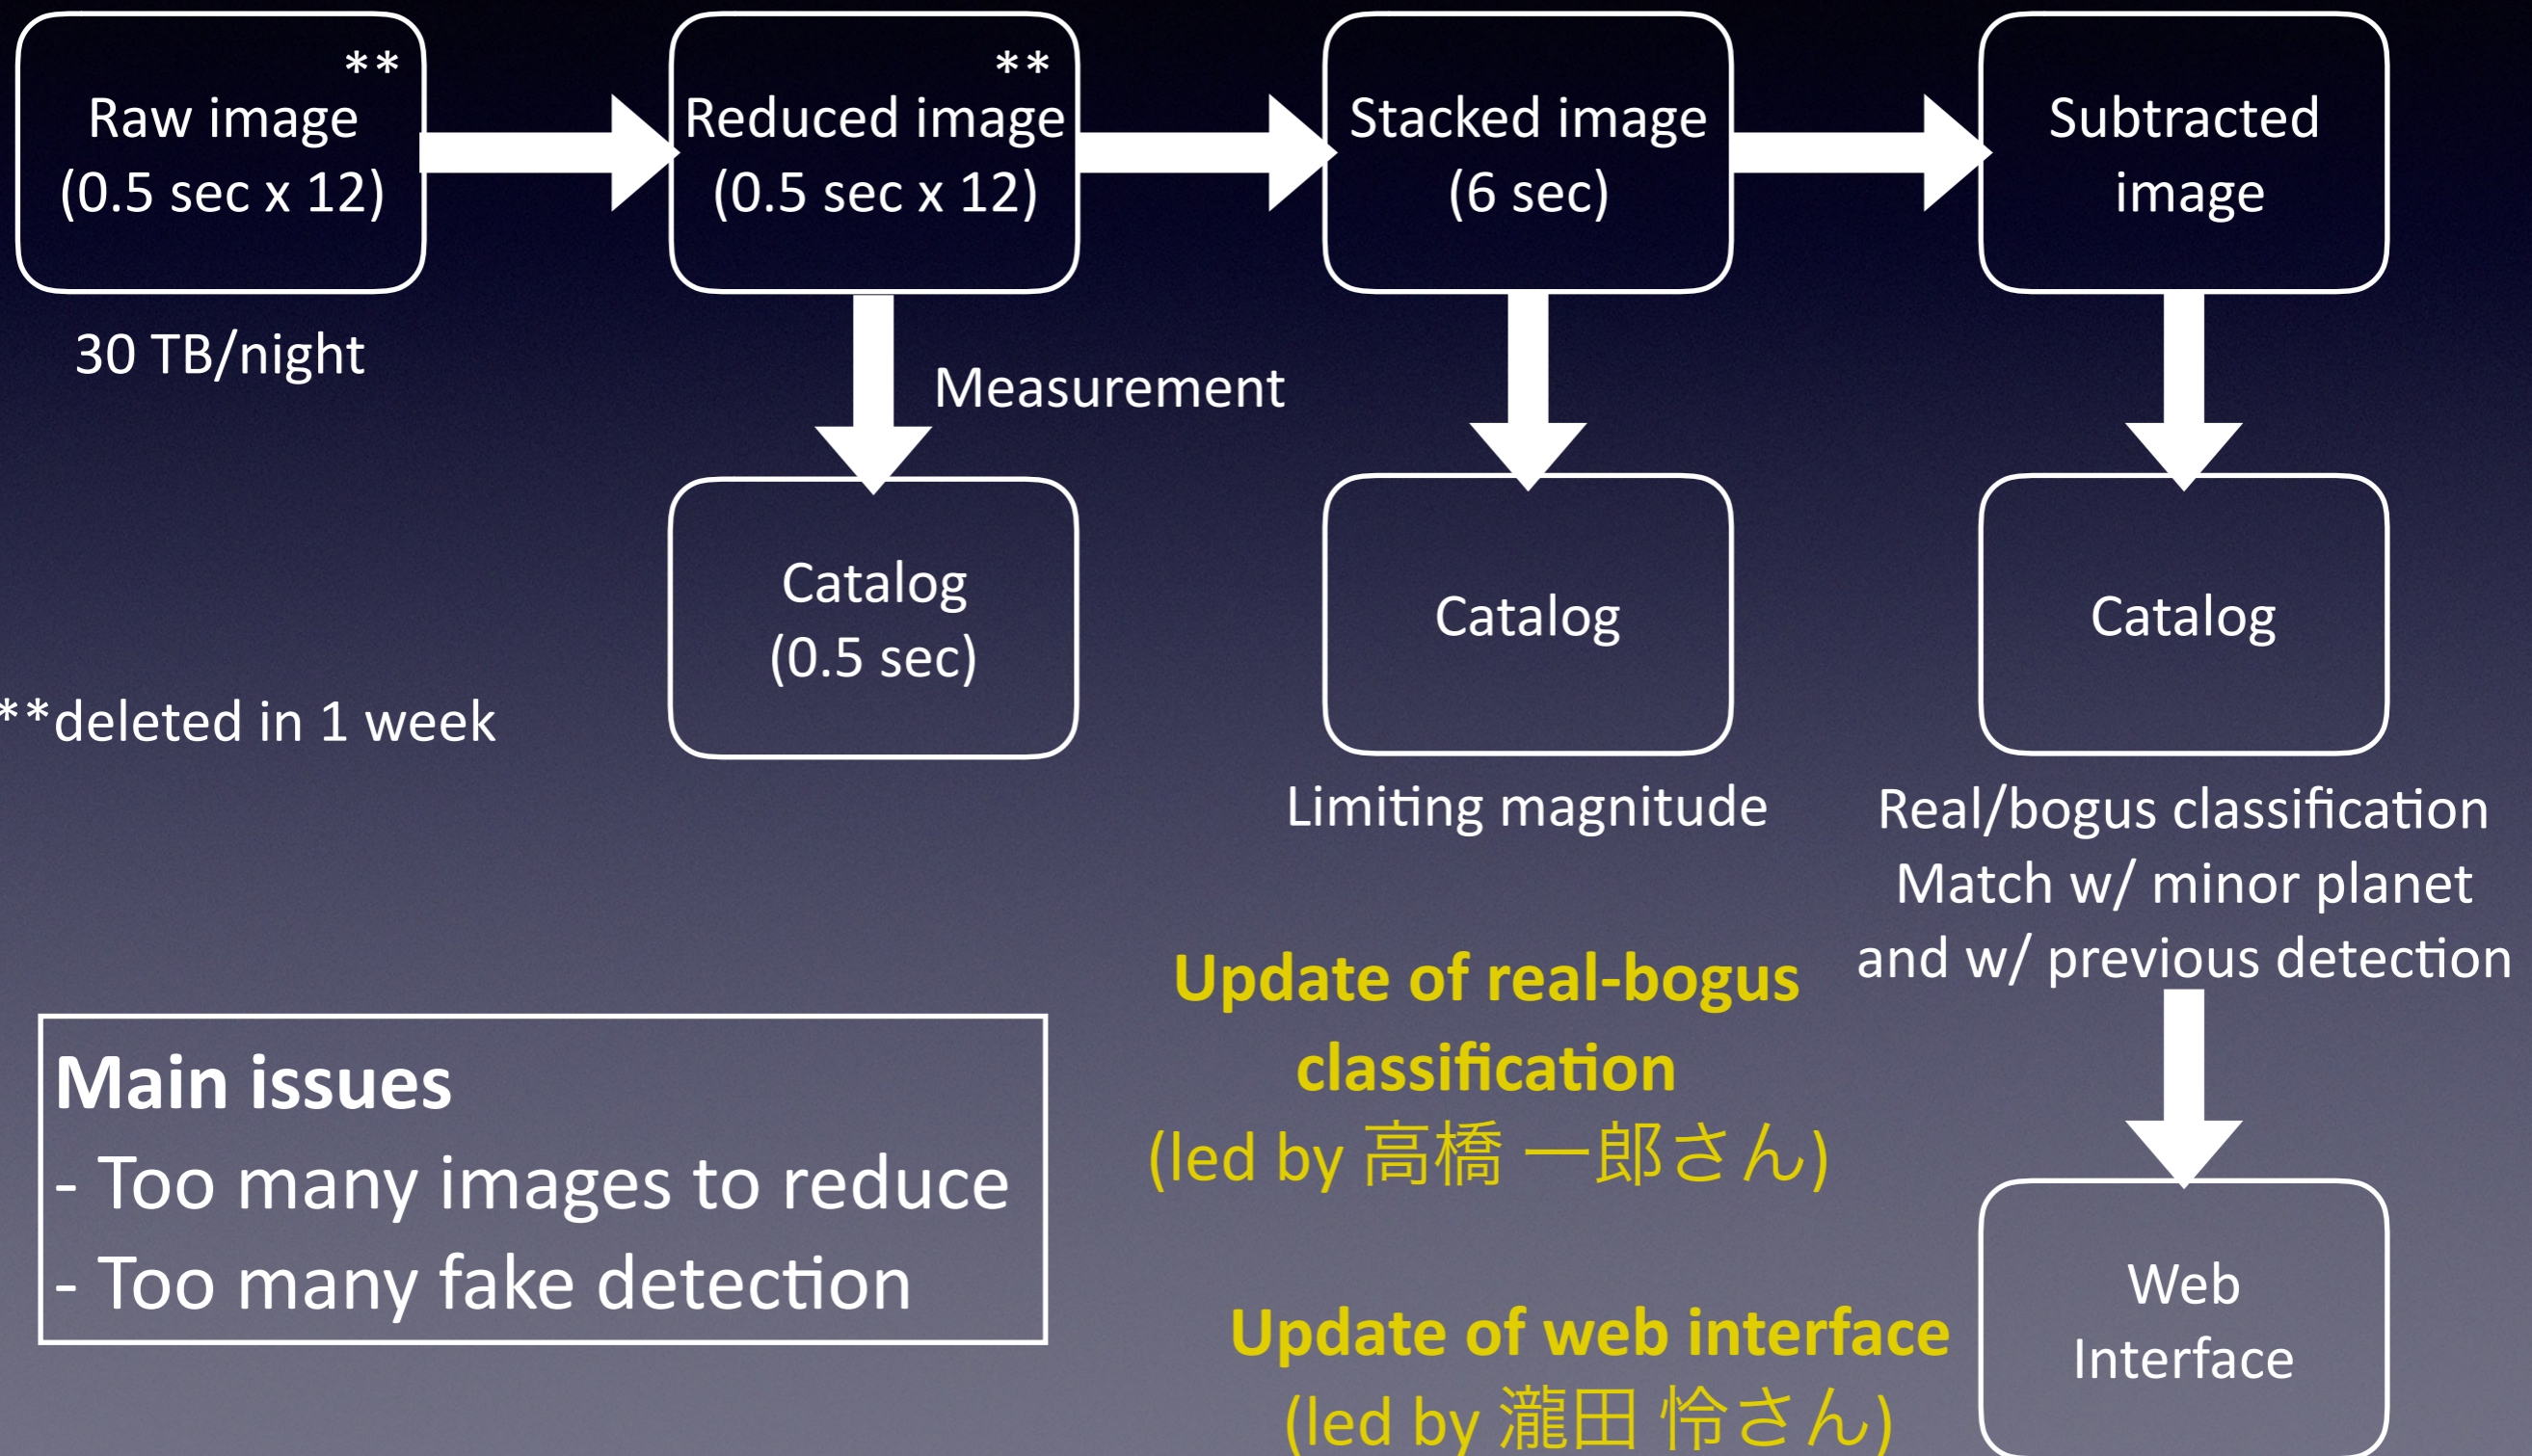

**Overall speed-up**  
(led by 富永 望さん)

**Update of reference images**  
(led by 新納 悠さん)

Standard reduction  
(+ astrometry)

Stack

Image subtraction  
(PS1, r-band)

# Challenges in transient detection

## Examples of difference images

**Fake/Real  $\gg$  1000**  
 **$\Rightarrow$  1% false positive rate**  
**is not good enough**

# Classification with Convolutional Neural Network (CNN)

Initial development: 浜崎 凌さん (甲南大)

Performance update: 高橋 一郎さん (東北大)

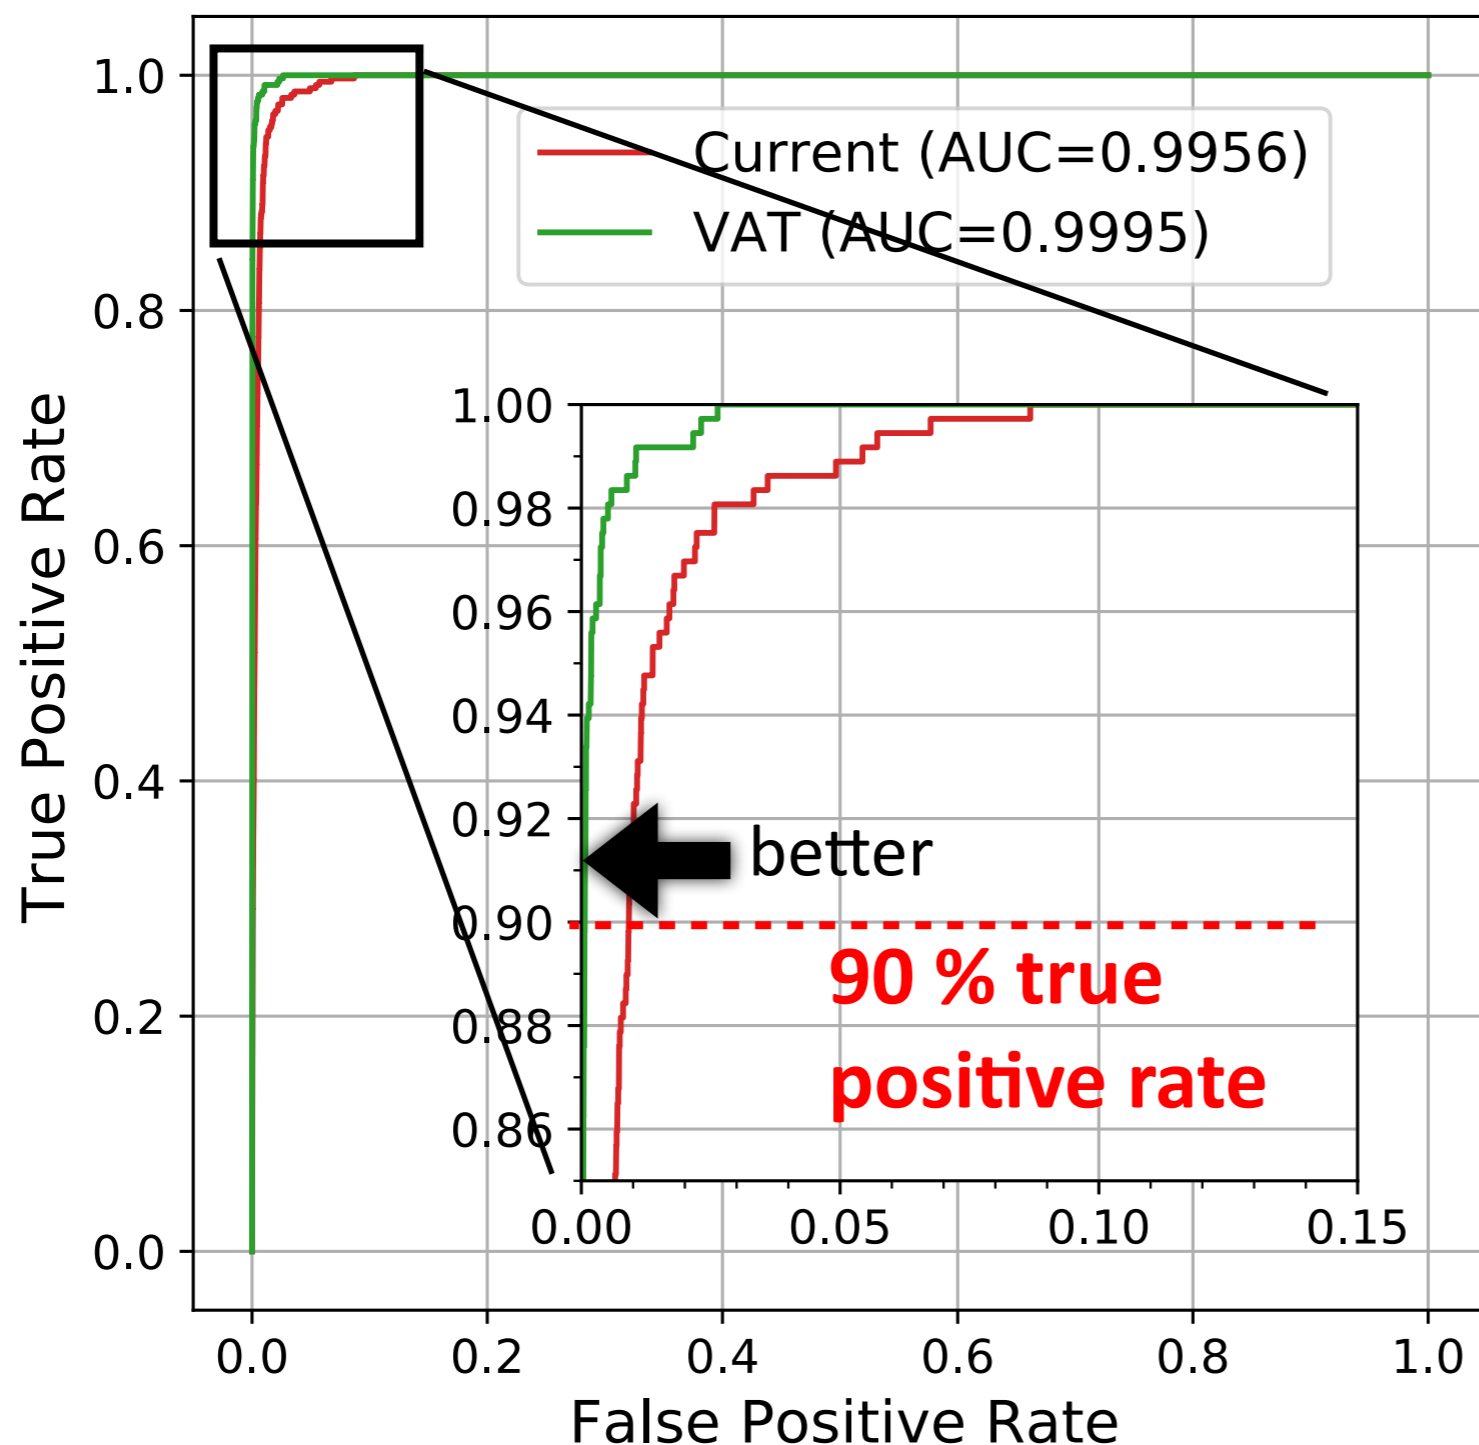

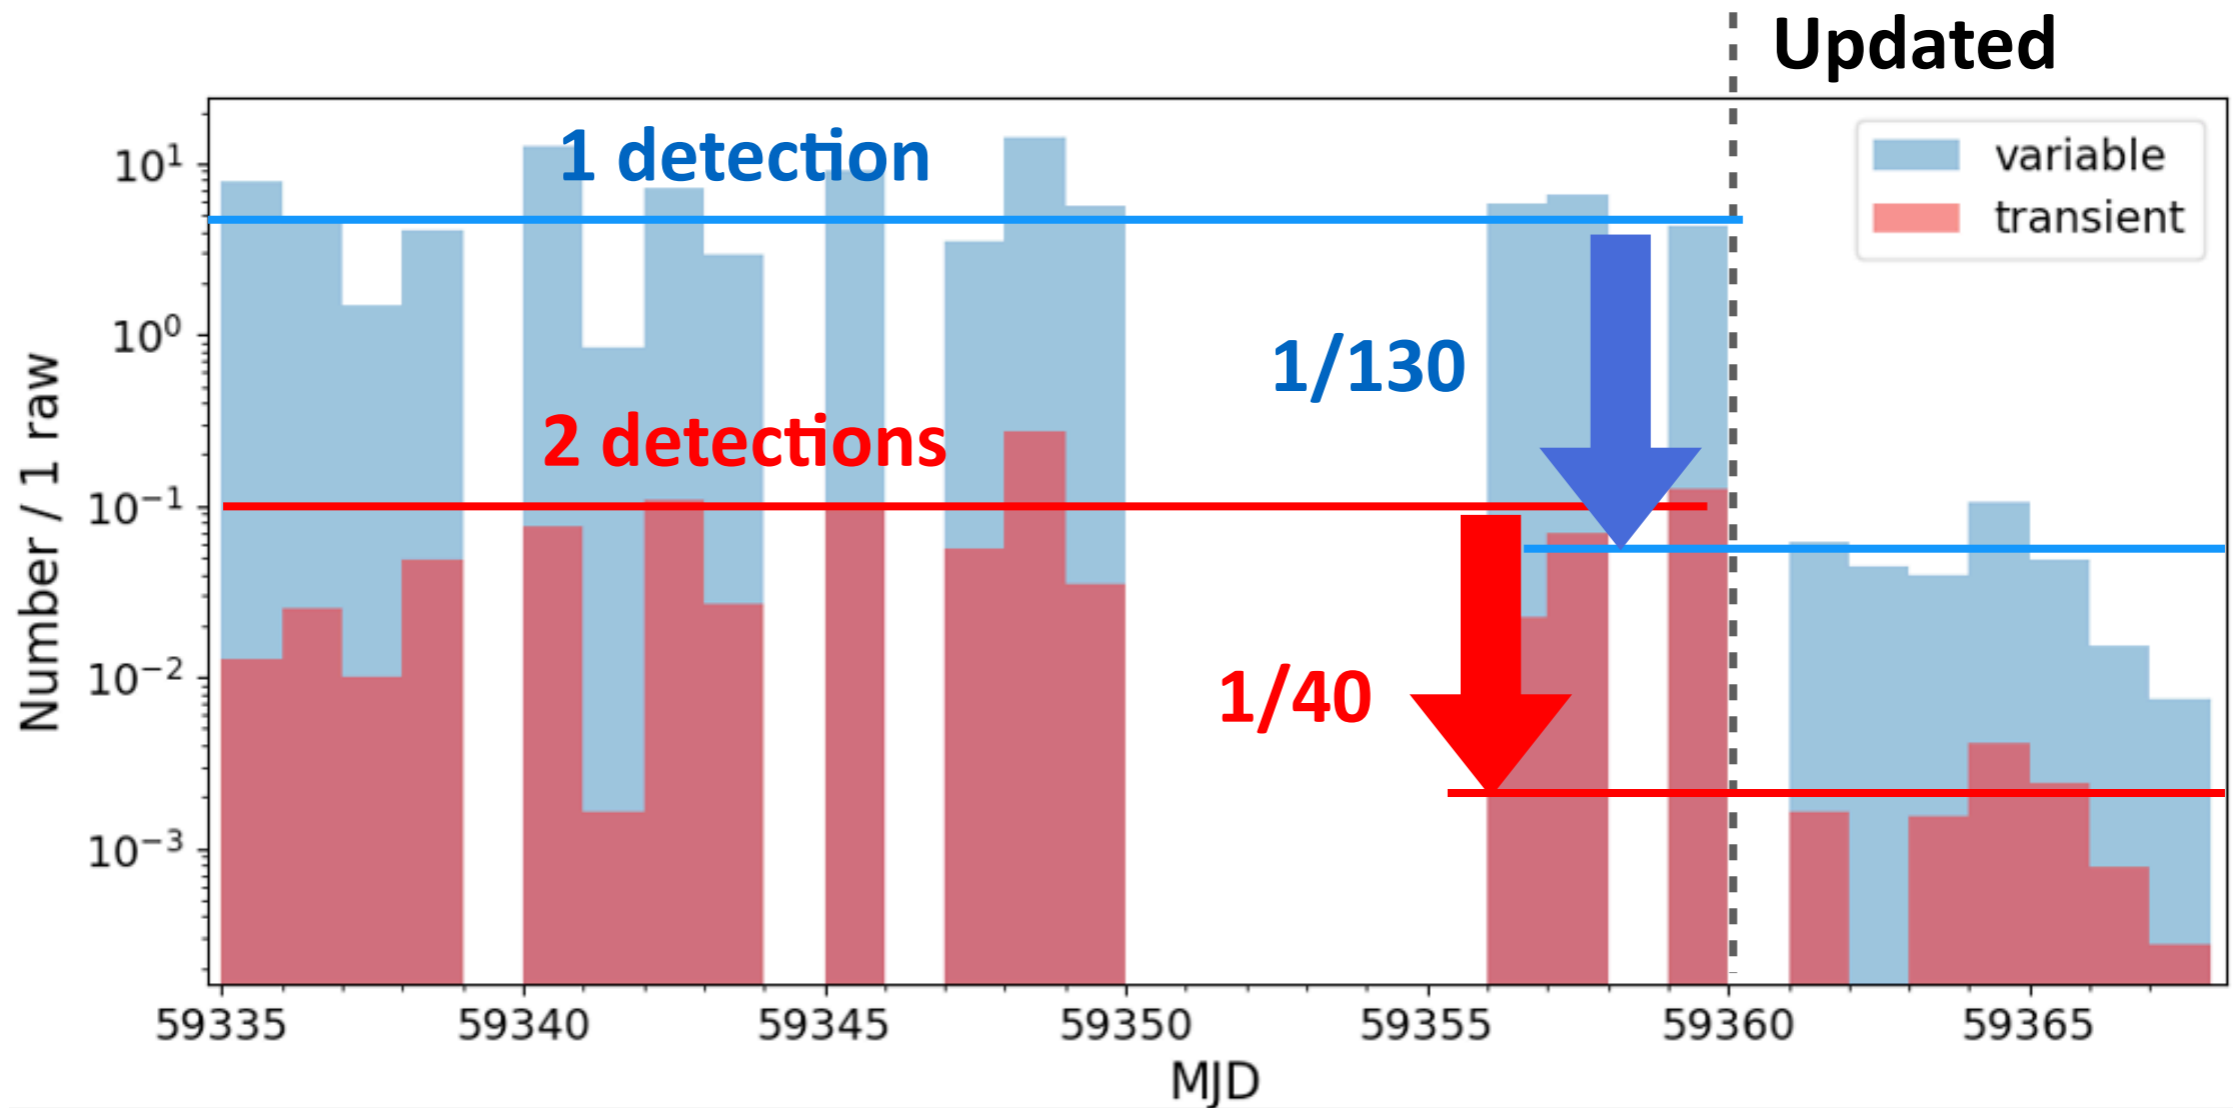

Figure by Ichiro Takahashi

False positive rate  
= 0.0006  
(at 90 % true positive  
rate)

# Performance of new machine

Figure by Ichiro Takahashi

~100,000 images / day

=> ~150 transient candidates / day = manageable number!

# Deep coadd reference for 20,000 deg<sup>2</sup> sky (PS1 => Tomo-e)

Led by 新納 悠さん (東京大)

Further improvement in real-bogus classification (identical response)  
=> automatic alert for high-confidence candidates

前田さん講演

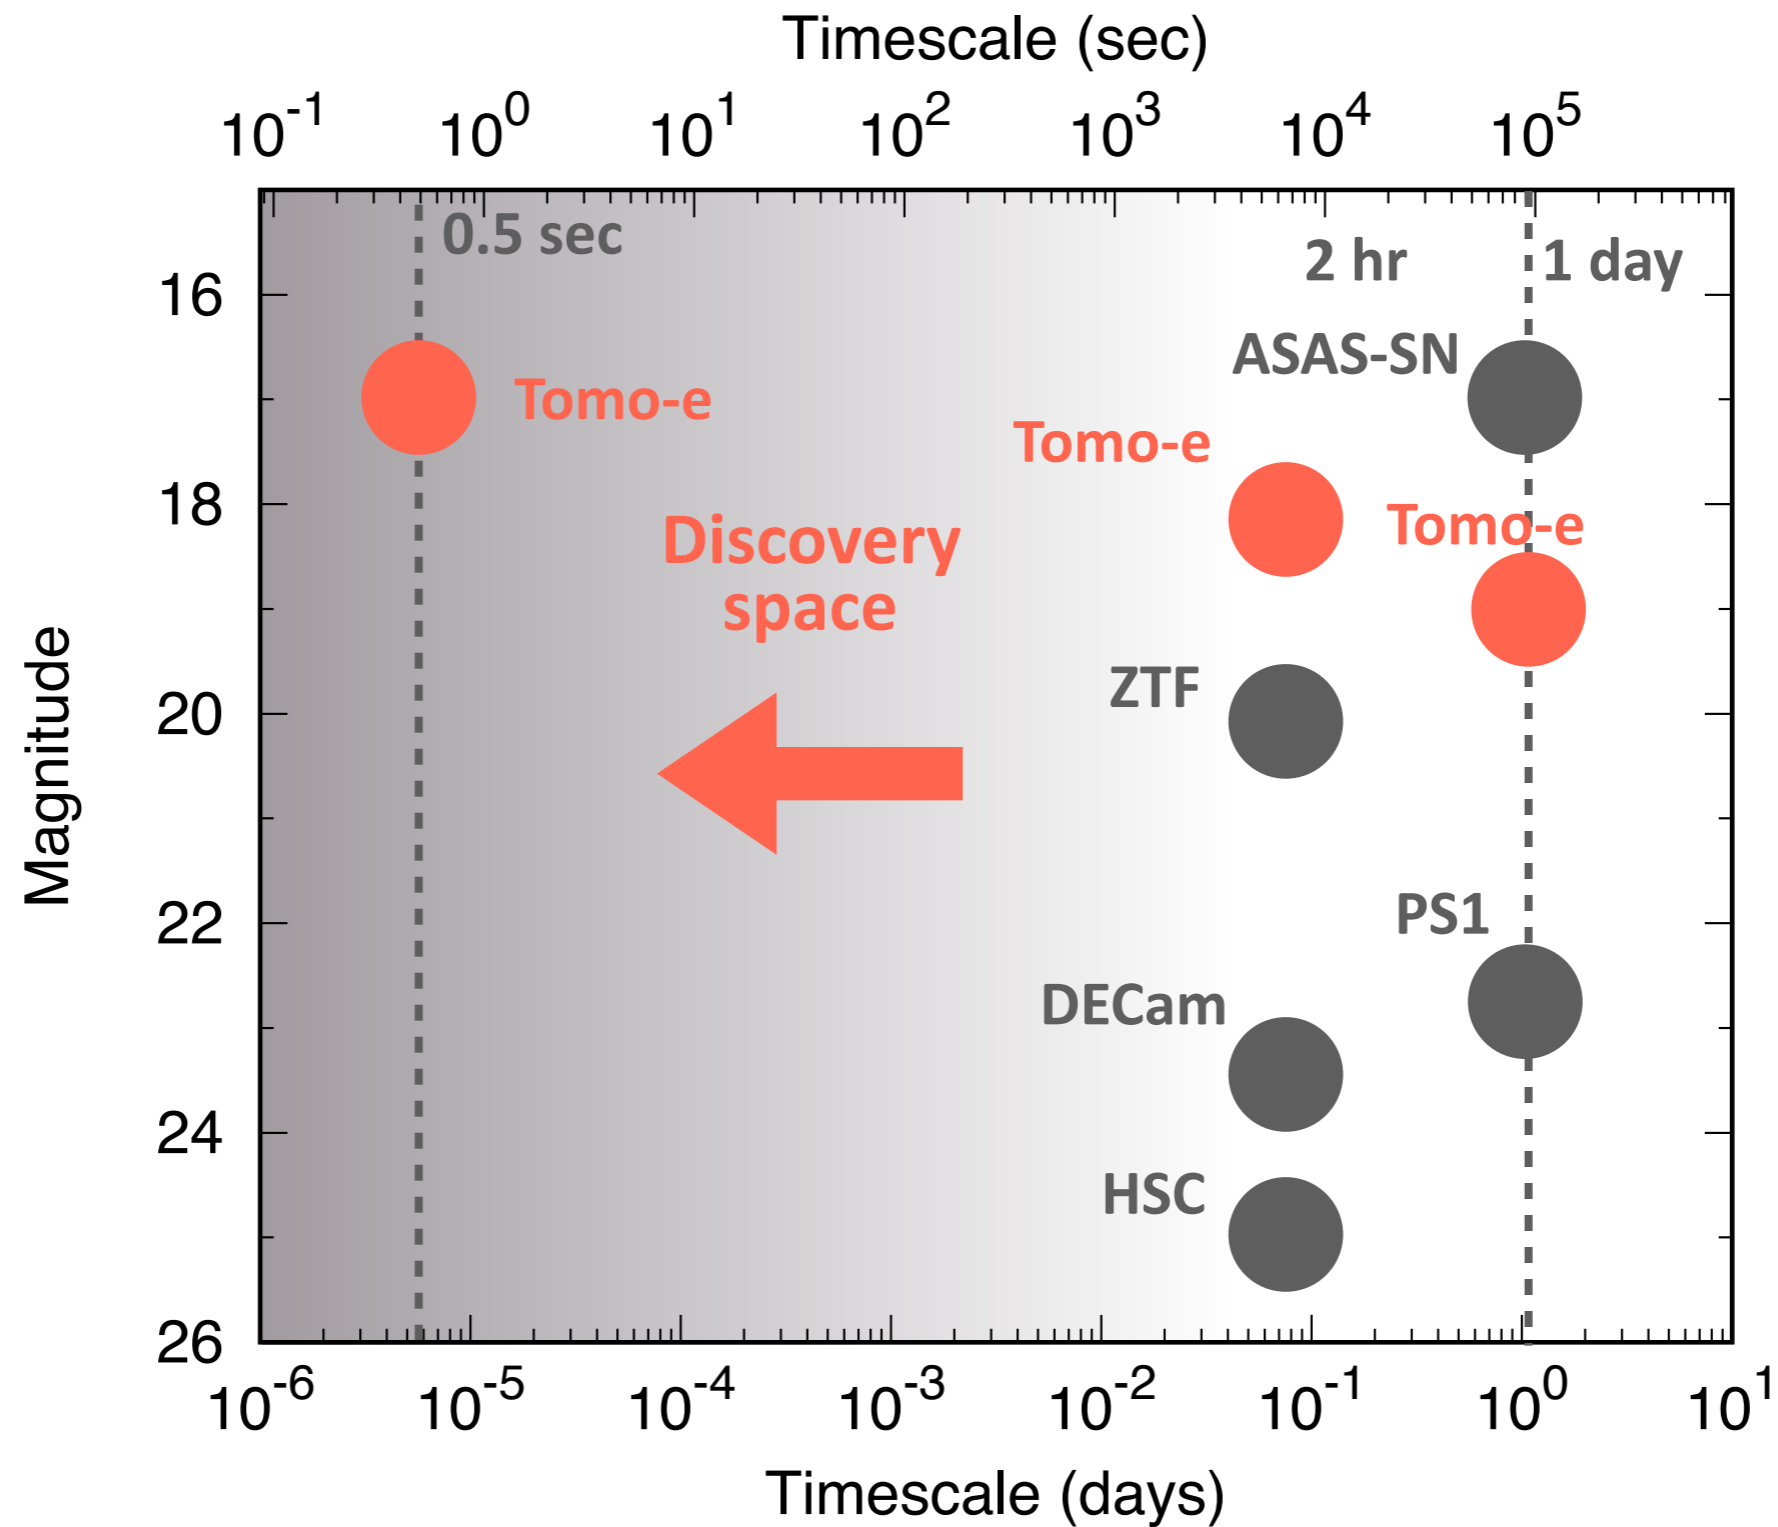

# Web interface

Led by 瀧田 怜さん (東京大)

# Toward higher time resolution

# Realtime analysis of "movie"

Application of  
object recognition technique  
(Single Shot Multibox detector  
= SSD, arXiv:1512.02325)

016

Watch out 16th frame

# Summary

## ● Frontier of transient sky

- Rapid transients: new kind of astronomical explosion
- Need rapid spectroscopic follow-up

## ● Tomo-e Gozen transient survey

- 7000 deg<sup>2</sup> - 2 hr - 18 mag
- A number of development work in the past years
  - Data reduction pipeline, Real-bogus classifier, Coadded reference images, Web interface, Reduction of movie data
- Feed good targets for Seimei
- Toward automatic alert for high-confidence candidates

昨日からの議論：「自動ToO観測」は非常にありがたいです

= 当日観測者に負担をかけない/依存しない、迅速な分光観測の実現
